Summary

Senior software engineer with 10+ years across a large delivery marketplace, a major cloud provider, and a global e-commerce company. Built the prototype that became a flagship conversational shopping agent and carried it through launch; now operates at platform scope, owning the tool layer that internal domain agents and external integrations build on, with AI coding tools in the daily workflow.

Experience

Company A

Senior Software Engineer

City, ST

Oct 2023 – Present

- Built the prototype that became the company’s conversational shopping assistant, launched Jun 2026: builds carts from recipe links, cookbook photos, and photographed shopping lists across roughly 800,000 products, personalized from order history and dietary preferences; the feature raised average order totals.
- Set the agent-platform direction: wrote the strategy and campaigned it through leadership, moving the company from third-party agent-protocol ordering—its first external agent integration—to a first-party in-app assistant.
- Own platform and reliability for the multi-agent assistant: the grocery domain agent plus the shared tool layer that also powers the restaurant agent, the third-party chat-app integration, and the company’s new developer CLI.
- Built the retail division’s integration-test framework and moved test execution from Jenkins to Buildkite on Kubernetes; golden-path ordering tests now run against segregated test tenants as blocking CI gates.
- Mentor engineers across the org on agent architecture and tool design, and drive team adoption of AI-assisted development—with architecture and security review before merge.

Company B

Software Development Engineer – IoT Services

City, ST

Jul 2019 – Jul 2022

- Built and launched an industrial IoT monitoring control plane (Go, DynamoDB, API Gateway), announced at the company’s flagship conference; drove it through operational readiness review to GA.
- Led a console migration from Angular to React on a microfrontend architecture with infrastructure-as-code pipelines, letting 5+ sub-teams ship independently and cutting release lead time from weeks to days.
- Designed SSO federation for the monitoring product and built synthetic canaries that caught console regressions before release.

Company C

Software Development Engineer – Compliance Technologies

City, ST

Jul 2015 – Jul 2019

- Built a secure platform (Ruby on Rails, Java Spring) for anti-money-laundering and identity-theft investigations, with end-to-end encryption, granular access controls, and audit logging.
- Built regulatory transaction-reporting systems for two European financial intelligence units, meeting the requirements for the company’s payments business in those markets.

Earlier Experience

Company D Software Engineering Intern; Company E Software Engineering Intern

City, ST

2013 – 2014

- Integrated a subscription book catalog into a social reading platform; tested handheld device software (smoke, regression, GUI).

Selected Projects

Multi-Agent Platform

Personal Project

- Run Python agents in production behind a FastAPI gateway, with Next.js web and Expo mobile clients sharing state over a streaming UI protocol.
- Protocol-backed tools for groceries, fitness, travel, trends, and public resume Q&A; the grocery tool started as the shopping-assistant prototype.

Education

State University

B.S., Computer Engineering, cum laude

City, ST

May 2015

Skills

Languages: Java, Kotlin, TypeScript, Go, Python, Ruby, SQL

Technologies: React, Next.js, Expo, AWS, CDK, DynamoDB, Java Spring, Ruby on Rails, FastAPI, Docker, Kubernetes

AI/Agents: MCP, Vercel AI SDK, Google ADK, Cloudflare Agents SDK, AG-UI, CopilotKit

Writing: Designing Tools for Agents
